

Эксперименты с лазерным ионным источником на установке ISOLDE (CERN; *R/LIS-IDS collaboration*)

Лазерный ионный источник на установке ИРИС
(ПИЯФ) —перспективы

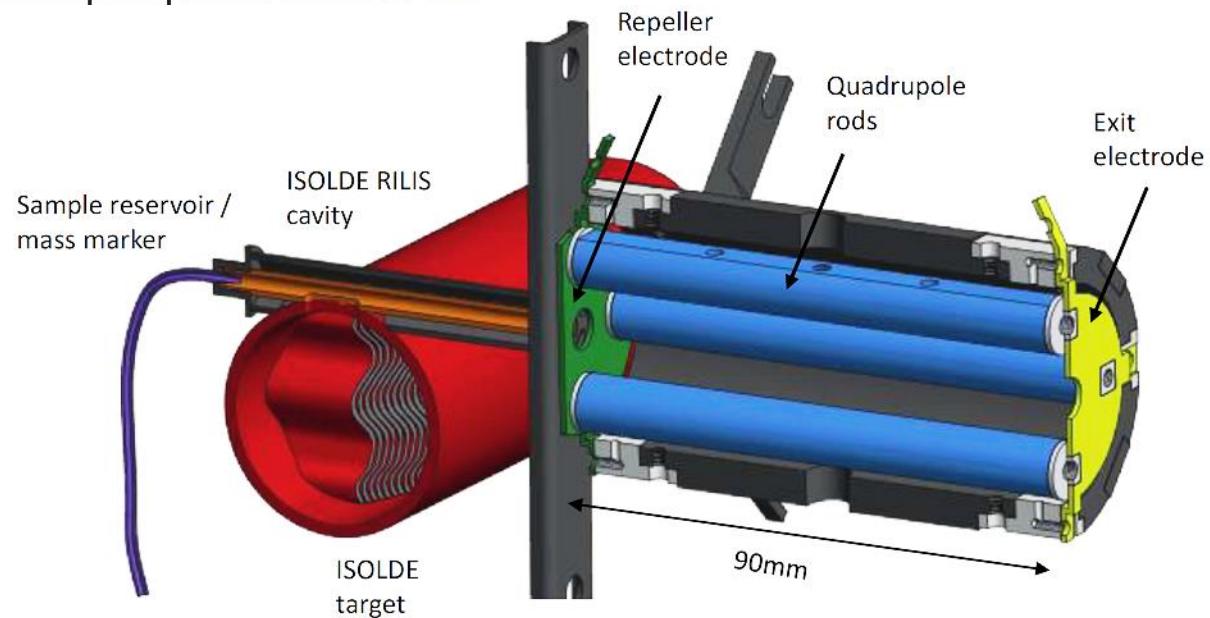

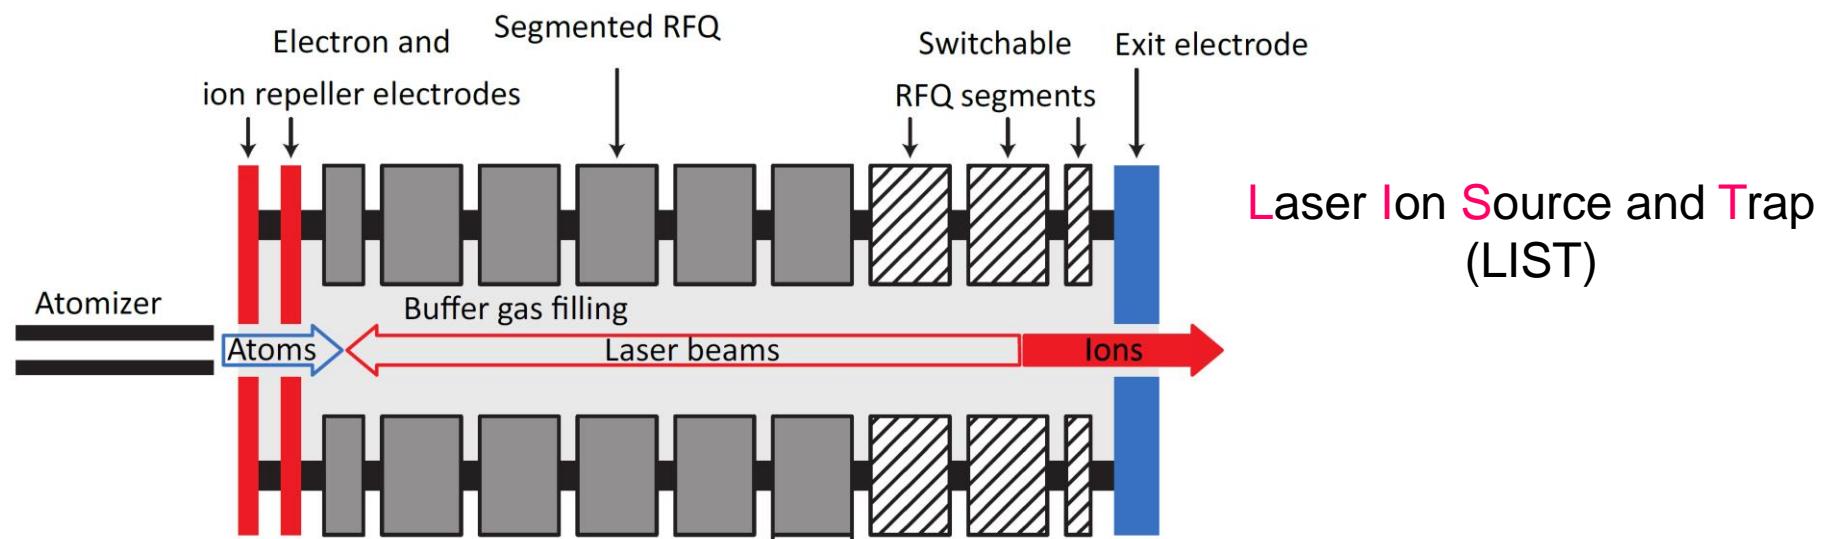

А. Е. Барзах, П. Л. Молканов, В. Н. Пантелейев,
М. Д. Селиверстов, Д. В. Федоров

New region of investigation

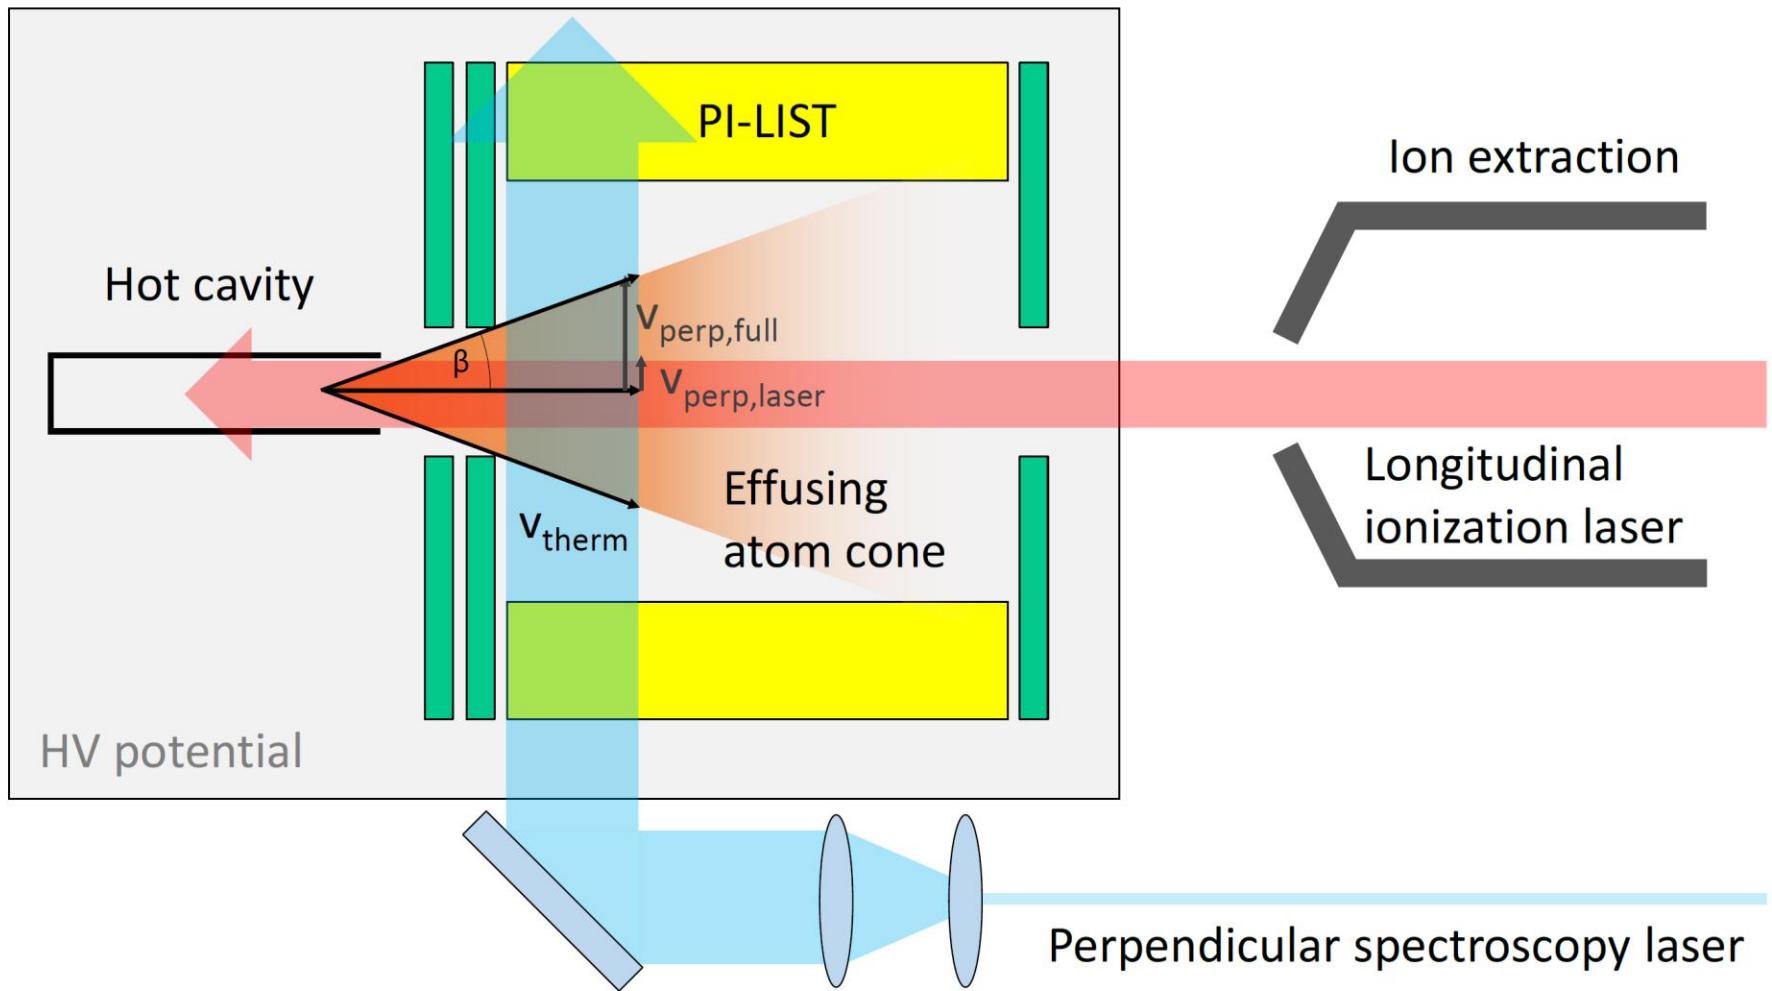

Preliminary results!

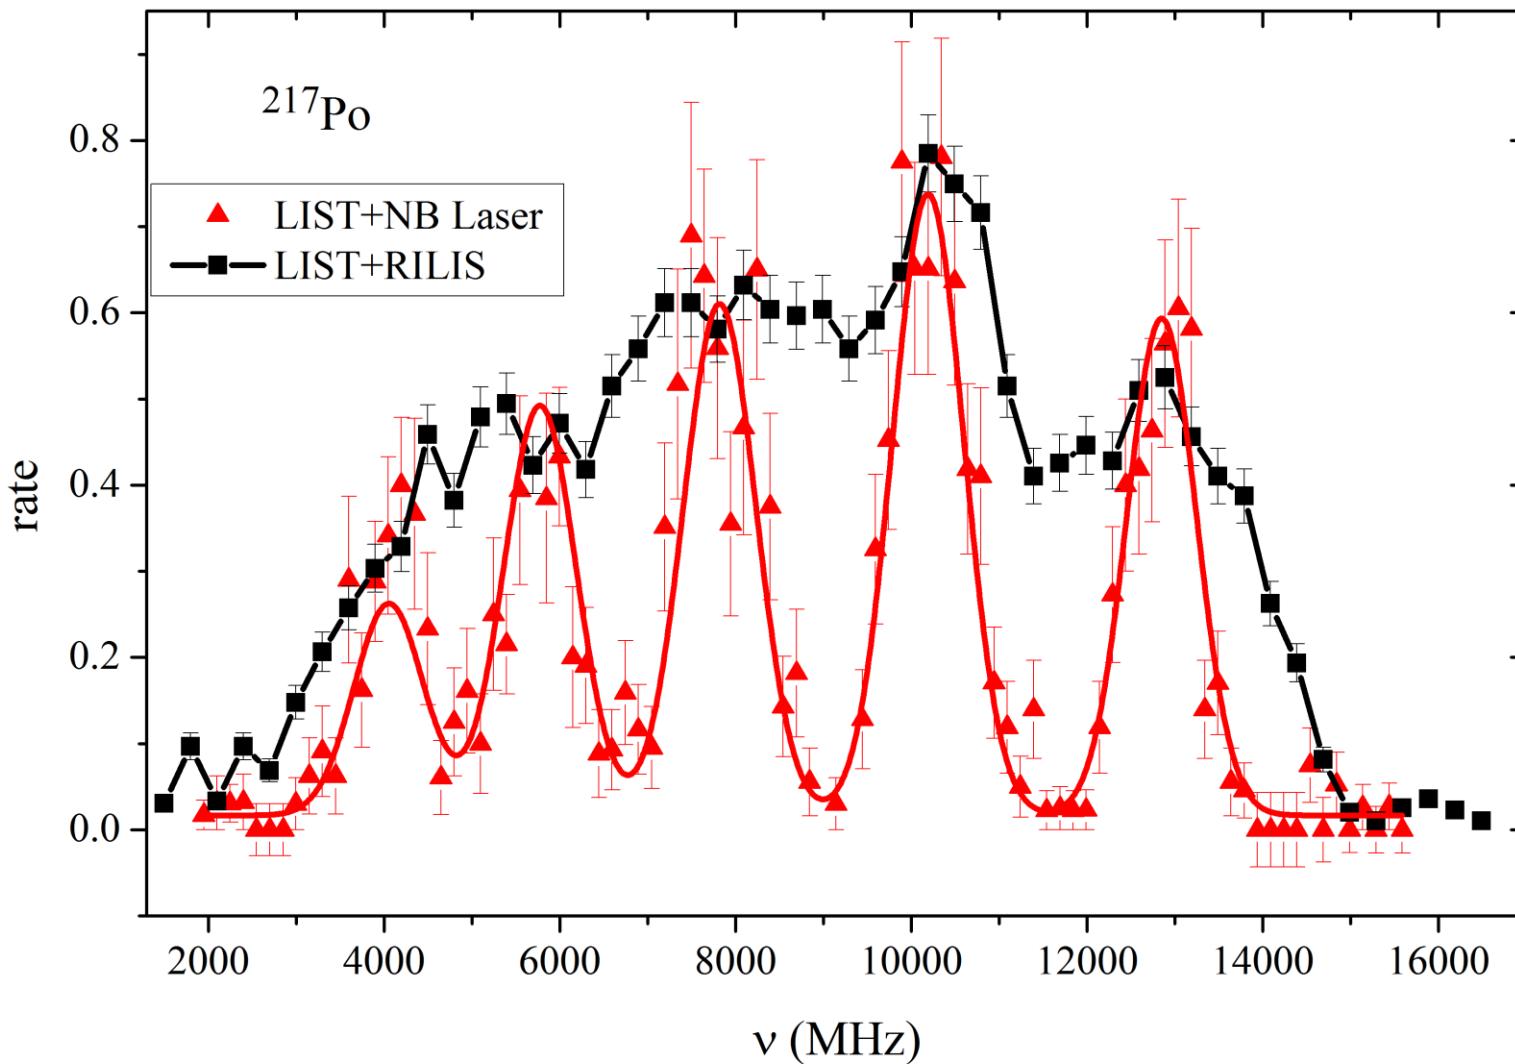

New device for IS/hfs studies in the case of overwhelmed background

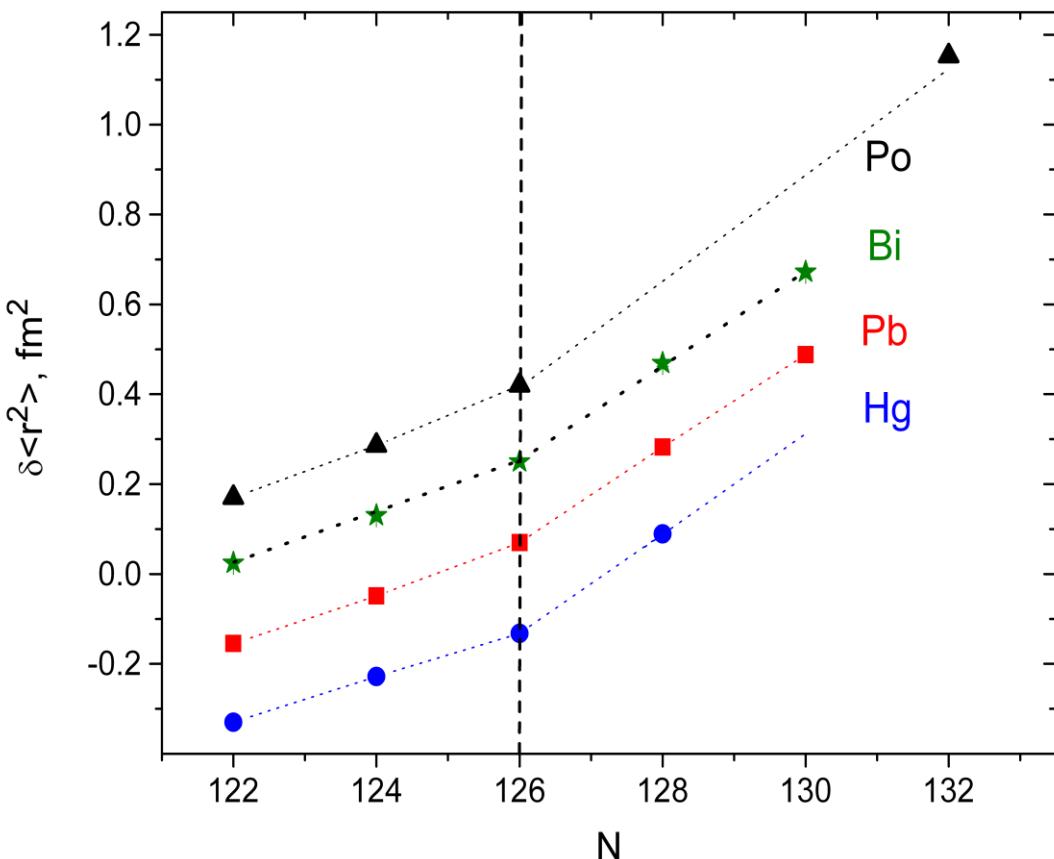

Perpendicularly Illuminated LIST (PI-LIST)

Improvement of resolution

Shell effect in charge radii

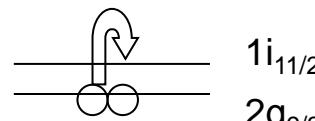

Ratio of the slopes (~2)
is exactly the same
for ^{82}Pb , ^{80}Hg and ^{83}Bi .
Is there any Z-dependence
at $Z = 81$ (Tl), 84 (Po)?

Theory (kink and OES):

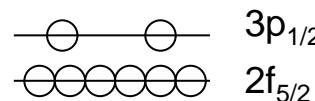

RHF

Fayans functional (overestimate)
NR-HF with modified spin-orbital
part (underestimate)

All: crucial role of $vi_{11/2}$ occupation

$N = 126$

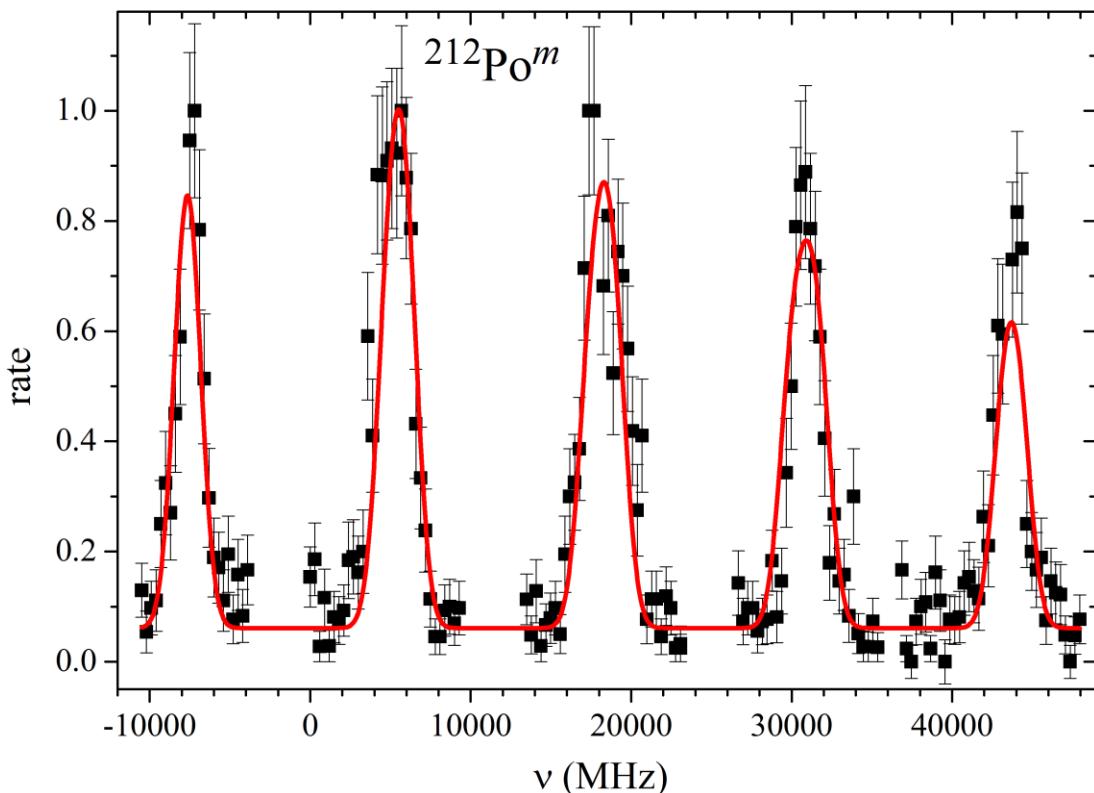

$^{212}\text{Po}^m$ as a benchmark for theory

Benchmark for theory: isomers with unpaired $i_{11/2}$ neutron

$^{212}\text{Po}^m$: tentative configuration $(\pi(h_{9/2}^2))_8 \otimes (vg_{9/2} \textcolor{red}{vi}_{11/2})_{10} {}_{18+}$

$\textcolor{red}{vi}_{11/2}$ occupancy should be markedly different in comparison with that in adjacent Po isotopes without neutron directly in $i_{11/2}$ shell

Background $\sim 2 \times 10^8$ 1/s ^{212}Fr

$$\mu_{\text{exp}} = 7.34(10) \mu_N$$

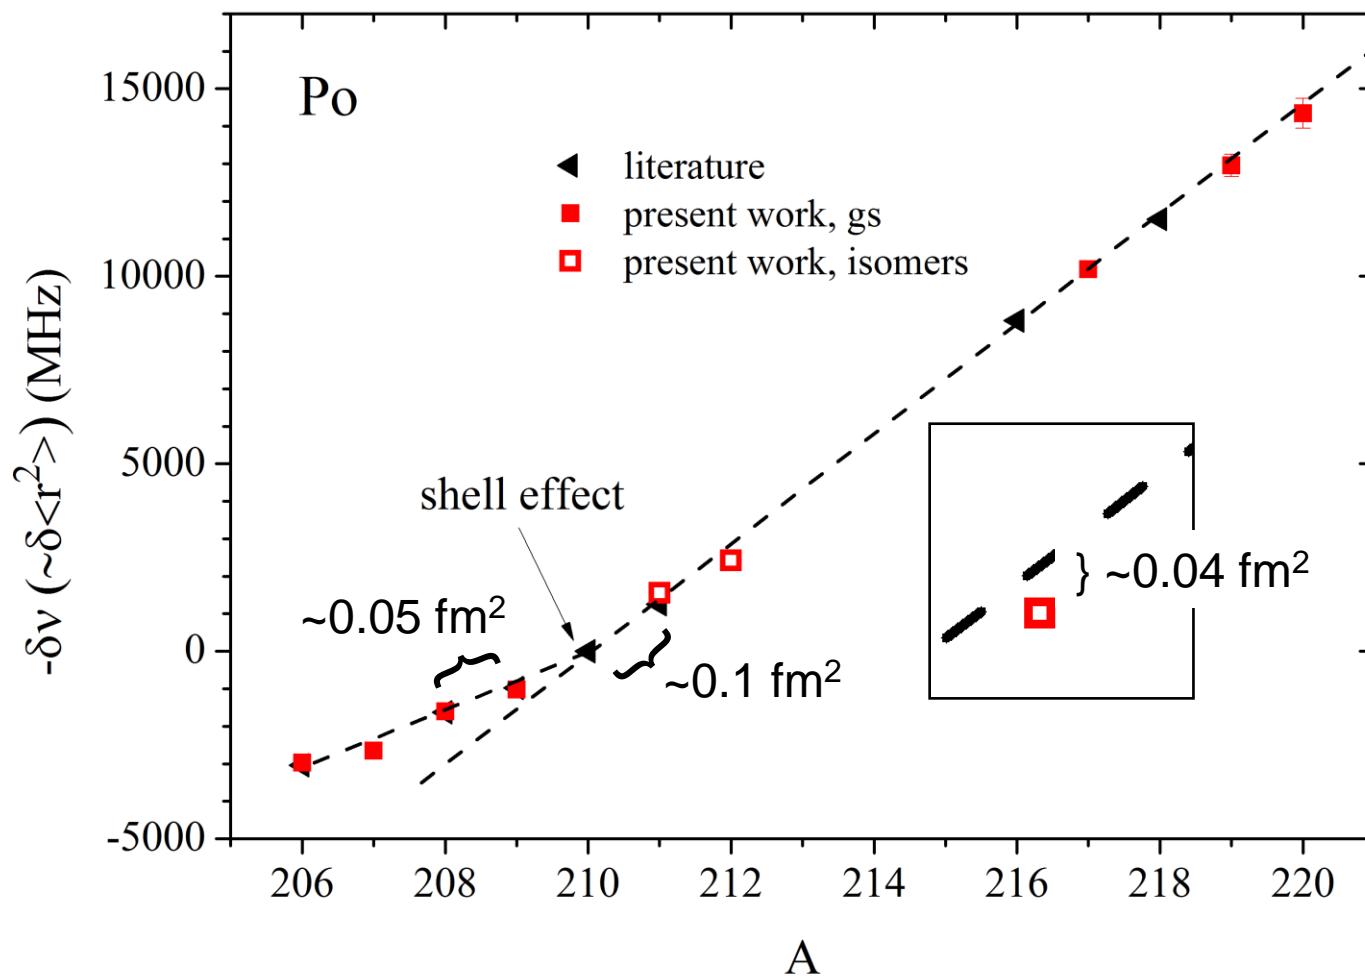

additivity relation:

$$\mu_{\text{add}} = 7.3 \mu_N$$

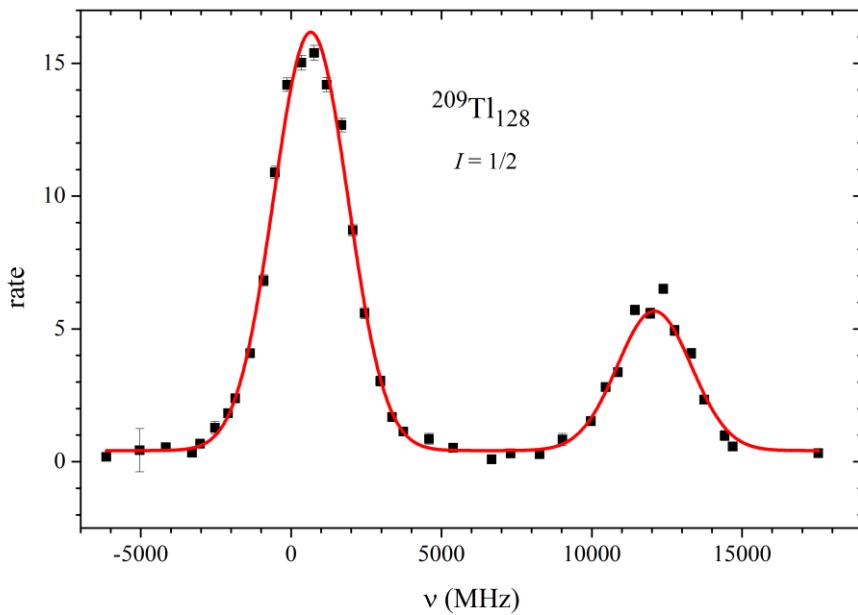

configuration is confirmed

Shell effect in Po charge radii

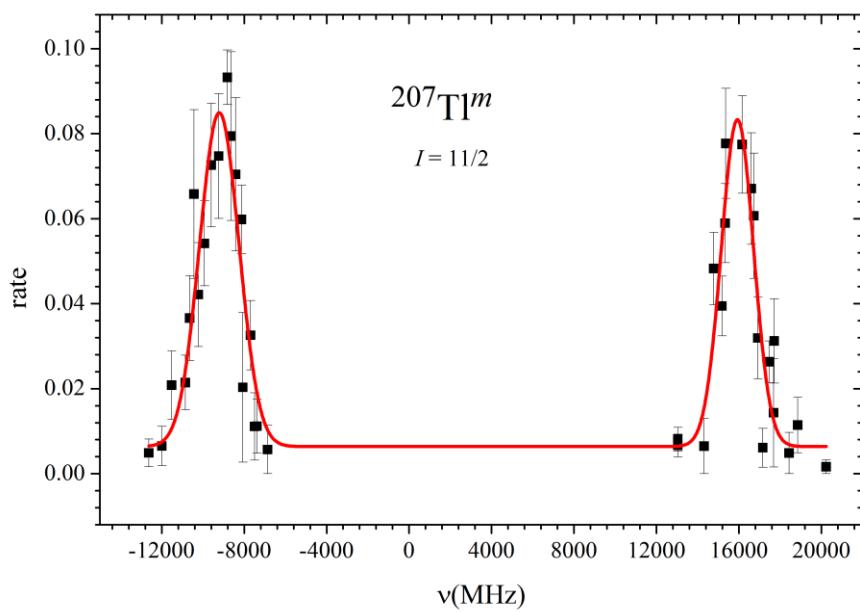

proposal for measurement high-spin
Bi isomers with unpaired $i_{11/2}$ neutron

Shell effect in Tl

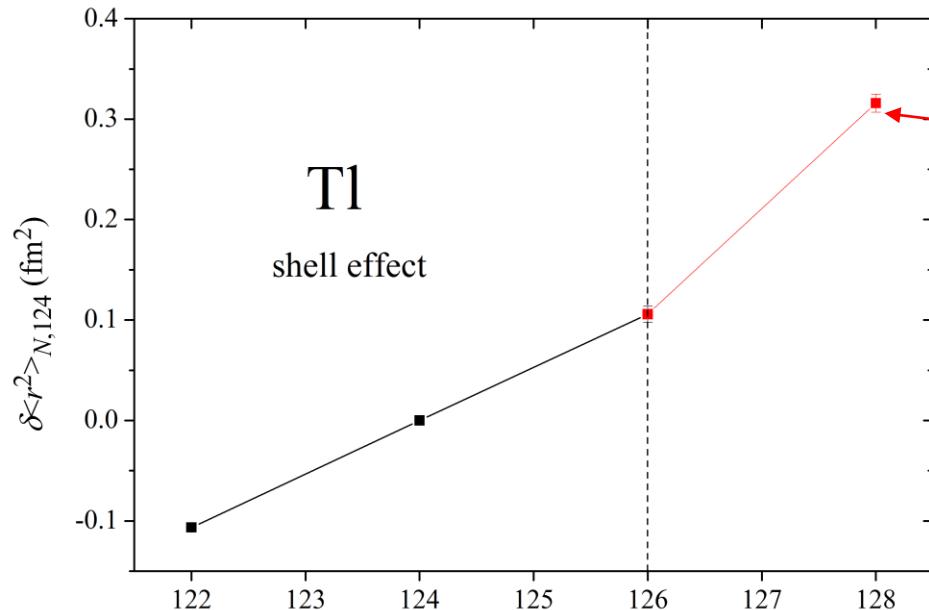

Background $\sim 8 \times 10^7$ 1/s ^{209}Fr

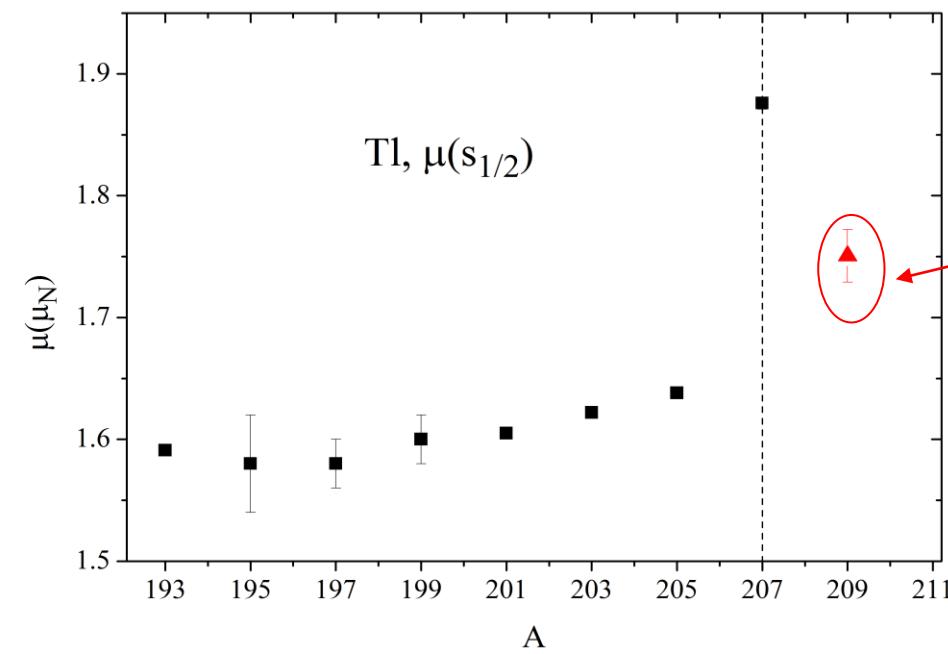

Background $\sim 4 \times 10^6$ 1/s ^{207}Fr

Shell effect in Tl

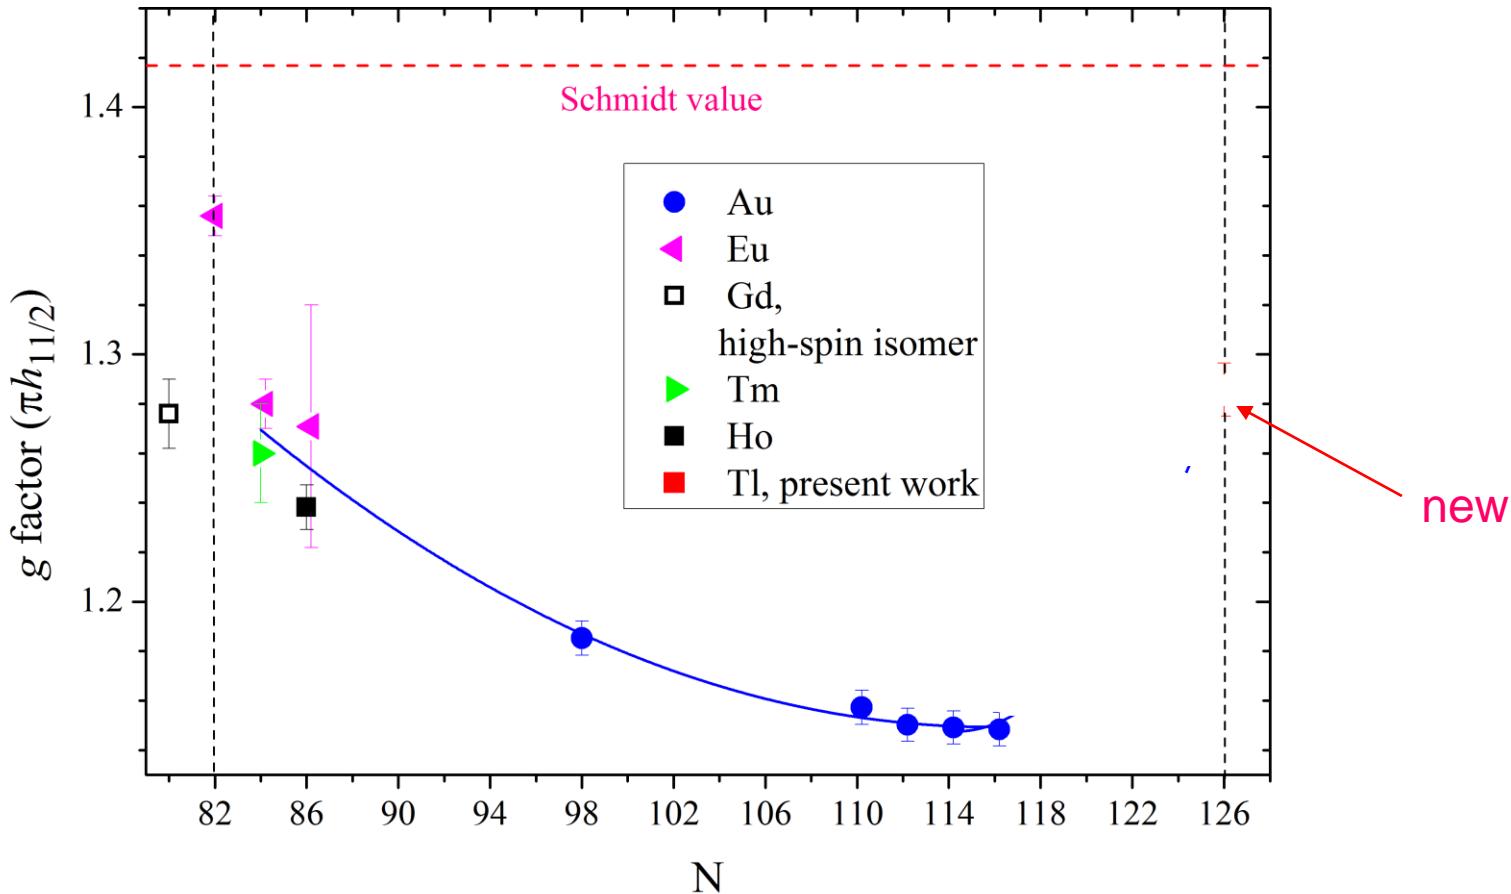

Ratio of the slopes (~2)
is exactly the same
as in Pb, Hg and Bi

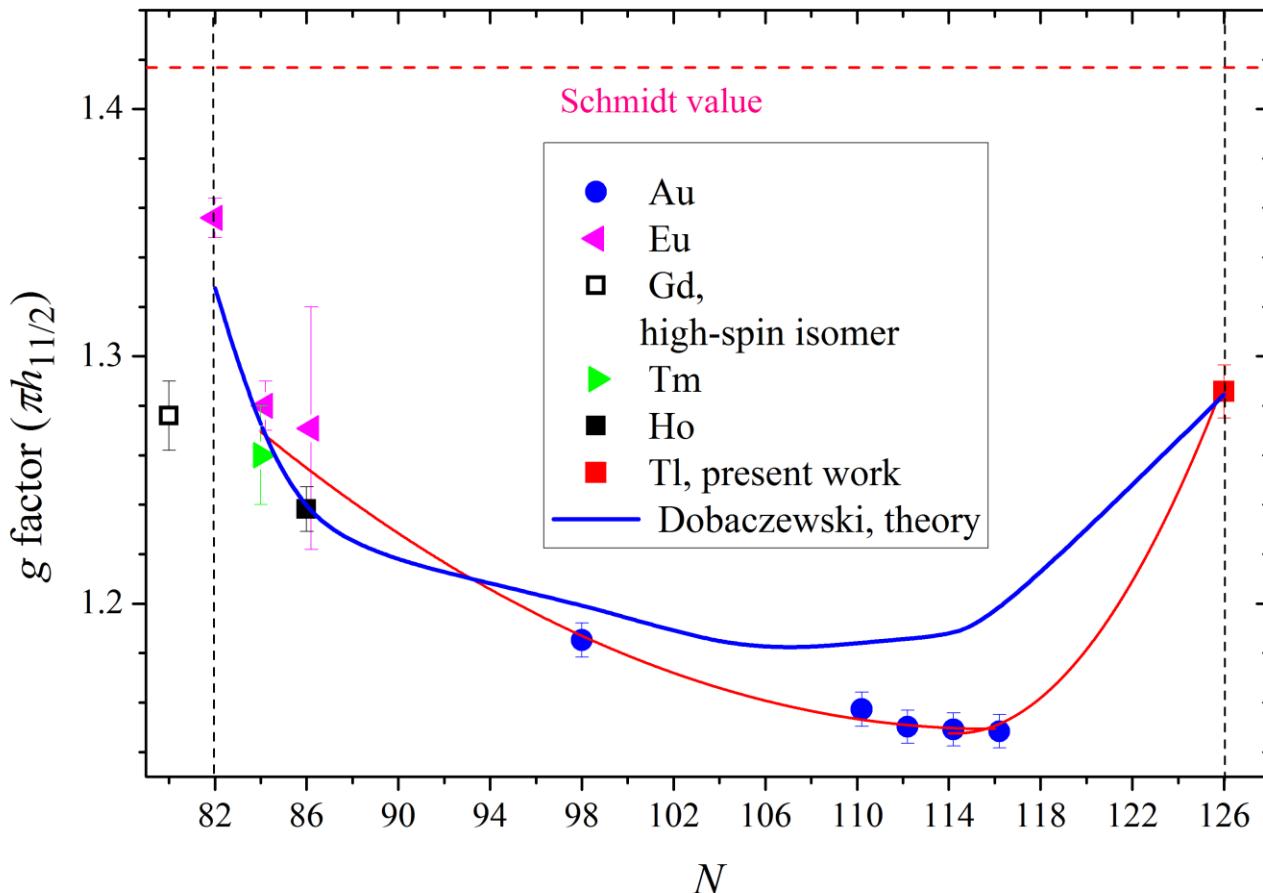

Octupole
correlations?

Shell effect in the $\pi h_{11/2}$ magnetic moments

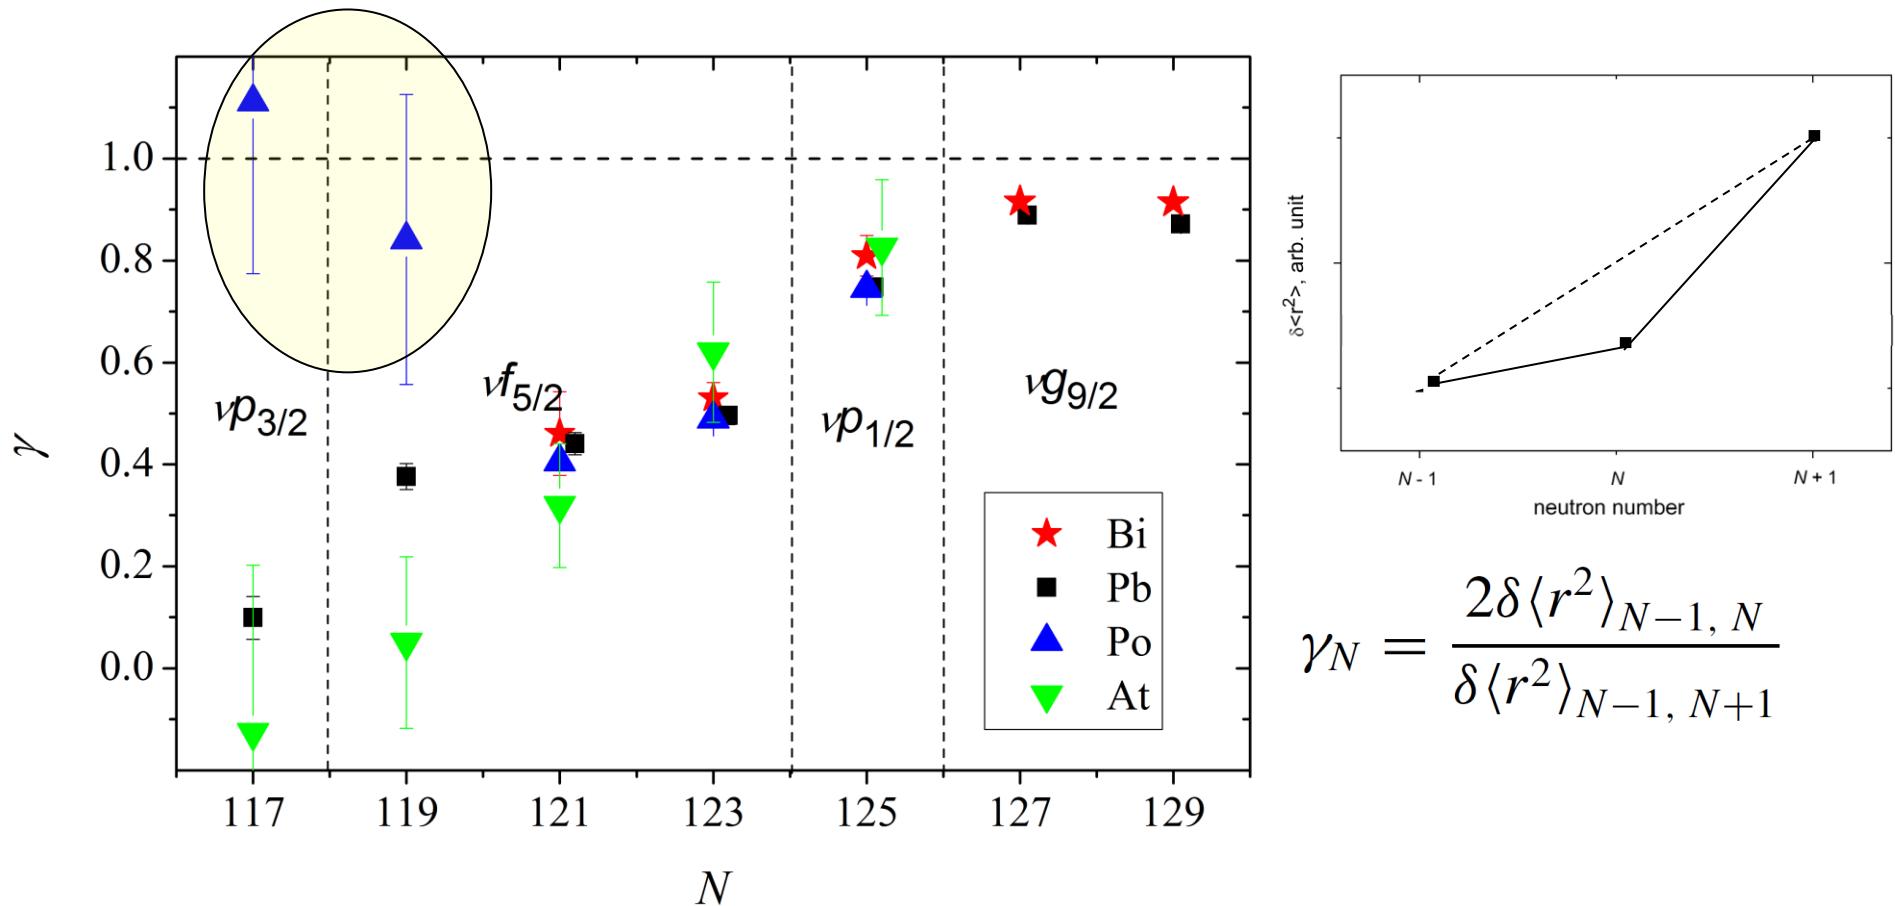

Shell effect in the $\pi h_{11/2}$ magnetic moments

an essential role of the time-odd core polarization and angular-momentum symmetry restoration.

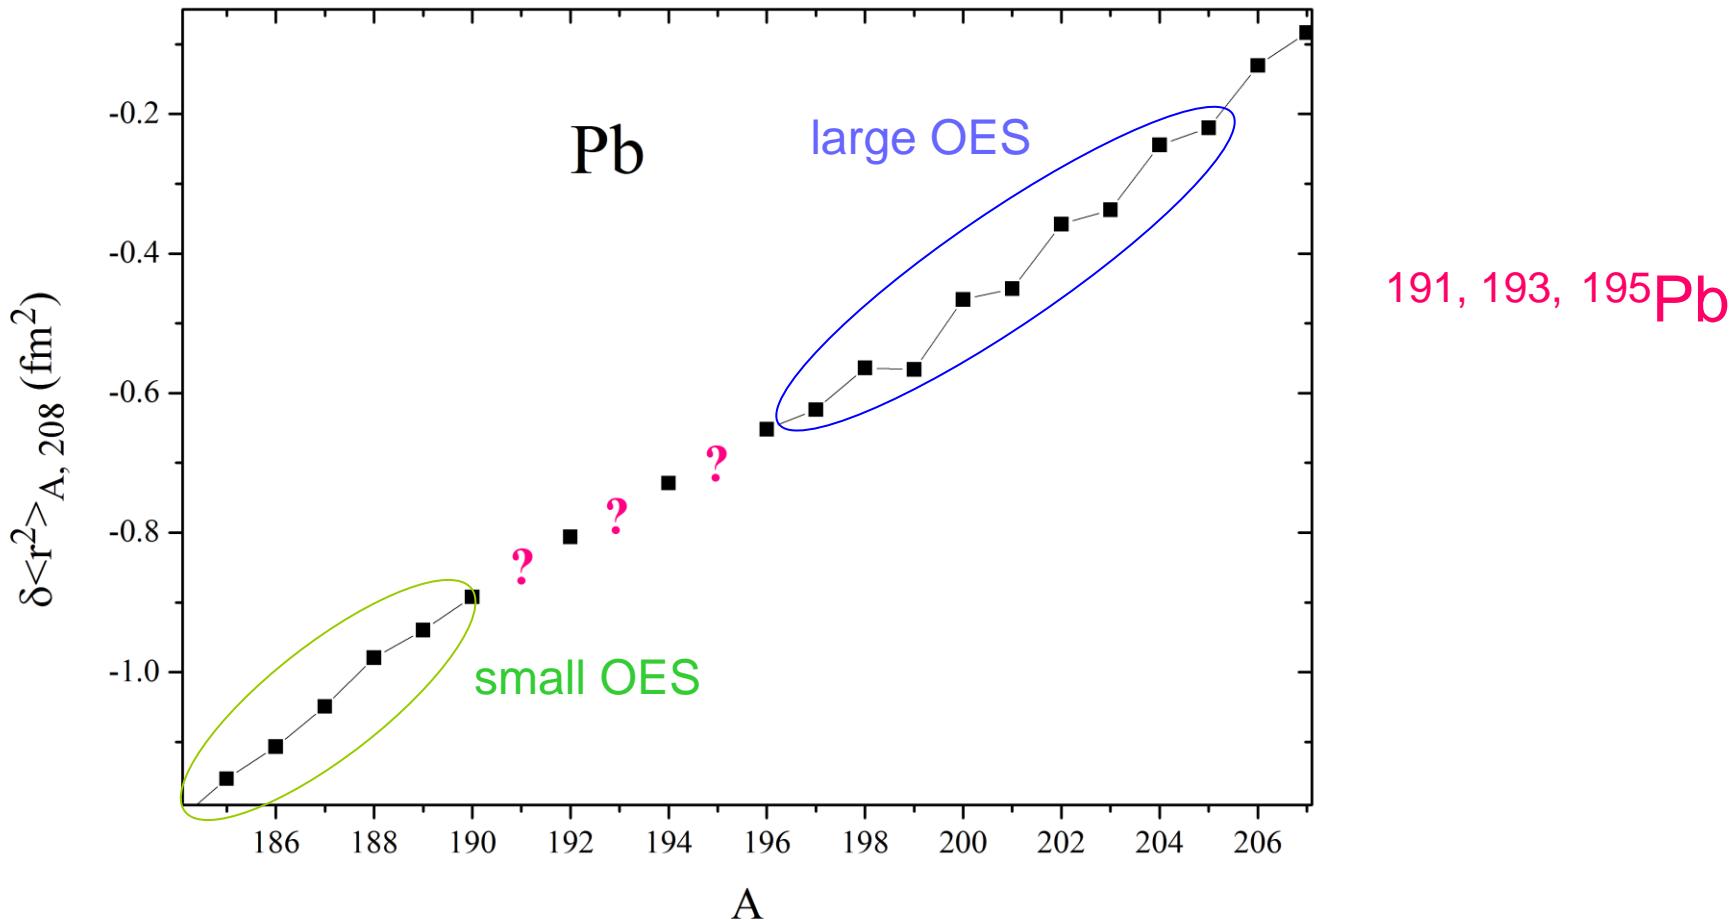

ИРИС: перспективы. Ро

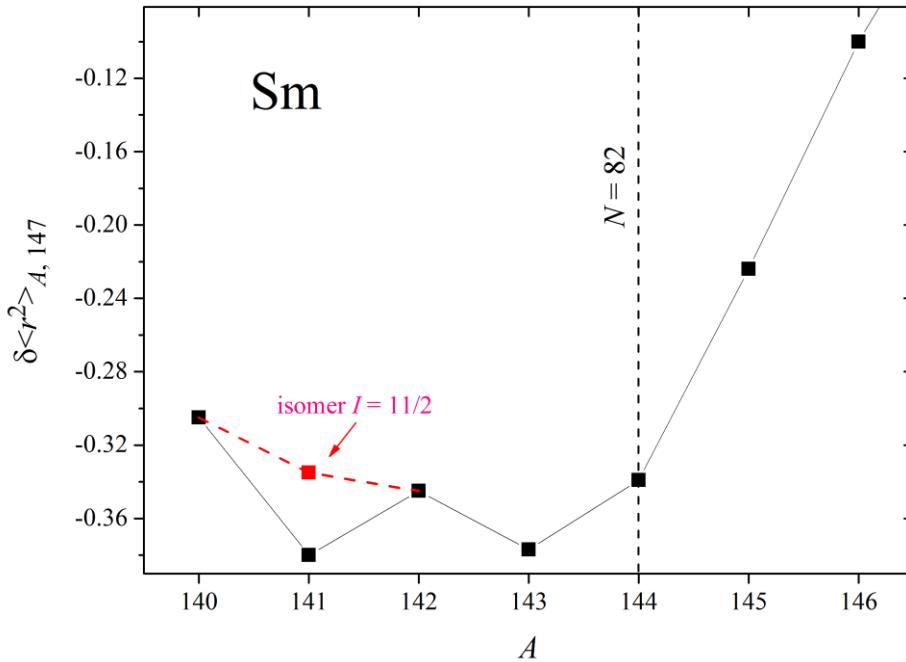

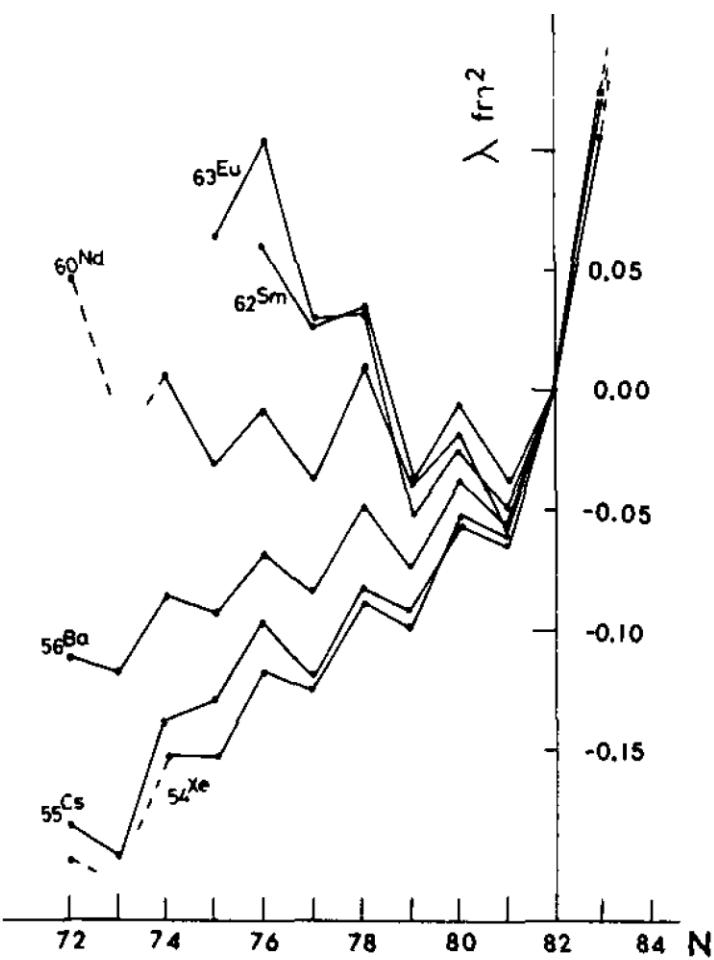

$$\gamma_N = \frac{2\delta \langle r^2 \rangle_{N-1, N}}{\delta \langle r^2 \rangle_{N-1, N+1}}$$

Измерить ИС для $^{200-204}\text{Po}$: в старых данных ошибка измерений или неожиданный эффект?

ИРИС: перспективы. Pb

ИРИС: перспективы. Редкоземельные

139, 143 $\text{Sm}_{79, 83}$, 137, 139, 141 $\text{Nd}_{79, 81, 83}$,
143, 145, 147 $\text{Dy}_{77, 79, 81}$, 141, 143, 145 $\text{Gd}_{77, 79, 81} \dots$

ИРИС: перспективы. Au

$^{196}\text{Au}^{m1,m2}$ ($I = 5, 12$), $^{194}\text{Au}^{m1,m2}$ ($I = 5, 11$), $^{192}\text{Au}^m$ ($I = 11$), $^{190}\text{Au}^m$ ($I = 11$)
 $^{197}\text{Au}^m$ ($I = 11/2$), $^{189}\text{Au}^m$ ($I = 11/2$)

Additivity rule

$$\mu(198m) = 5.85(9)\mu_N$$

↓

$$\text{Configuration: } (\pi h_{11/2} \otimes vi_{13/2})_{12^-} \Rightarrow \mu(12^-) = \mu(\pi h_{11/2}) + \mu(vi_{13/2})$$
$$\Rightarrow \mu(vi_{13/2}) = -0.13(1)\mu_N$$
$$\text{Compare: } \mu(vi_{13/2}, \text{Pb, Hg}) \approx -1.0\mu_N$$

Violation of additivity rule? Or neglect of HFA?

Итоги

1. Измерены IS/hfs для тяжелых изотопов Ро и Тl.
2. Получены новые данные, которые помогут понять природу оболочечного эффекта в радиусах.
3. Новый теоретический подход к расчету магнитных моментов получил сильное подтверждение успешным описанием систематики $\mu(\pi h_{11/2})$ и прежде всего резкого скачка μ у $^{207}\text{Tl}^m$.
4. Измерения стали возможны благодаря использованию новой конфигурации мишенно-ионного устройства, — LIST, — позволившей проводить исследования в условиях преобладающего фона поверхностной ионизации.
